1 Integration Practice and Theory/Application

1.1 FToC I

Recall that we can solve a definite integral using the following definition:

$$\int_a^b f(x)dx = F(b) - F(a)$$

1.2 Change of Variables / U-Substitution

Suppose we need take the antiderivative of $\int 2x\cos(x^2)dx$, let us suppose that $g(x) = x^2$, then we know $g'(x) = 2x$. We also know that $\int \cos(x)dx = \sin(x) + C$. If we combine these, we can derive the answer as:

$$\sin(x^2) + C = \int 2x\cos(x^2)dx$$

Theorem 1.1. *Let us take $u = g'(x) \to \frac{du}{dx} = g'(x)$ and $du = g'(x)dx$. We can then derive the following:*

$$\begin{aligned} f(g(x)) &= \int (f \cdot g)'x \\ &= \int f'(g(x))g'(x)dx \\ &= \int f'(u)du \end{aligned} \tag{1}$$

1.3 Examples:

Consider the following substitution $u = 3x \to du = 3x \to \frac{1}{3}du = dx$, we can then solve:

$$\begin{aligned} \int \cos(3x)dx &= \frac{1}{3}\int \cos(u)du \\ &= \frac{1}{3}\sin(u) + C \\ &= \frac{1}{3}\sin(3x) + C \end{aligned} \tag{2}$$

Consider the following substitution $u = 2x^2 + 1 \to du = 4x\ dx$, we can then solve:

$$\begin{aligned} \int \frac{x}{2x^2+1}dx &= \frac{1}{4}\int \frac{du}{u} \\ &= \frac{1}{4}ln(u) + C \\ &= \frac{1}{4}ln(2x^2+1) + C \end{aligned} \tag{3}$$

Consider the following substitution $u = 1 + x \to du = dx \to u - 1 = x$

$$\begin{aligned} \int x\sqrt{1+x}\ dx &= \int (u-1)u^{\frac{1}{2}} \\ &= \int u^{\frac{3}{2}} - u^{\frac{1}{2}}du \\ &= \frac{2}{5}u^{\frac{5}{2}} - \frac{2}{3}u^{\frac{3}{2}} + C \\ &= \frac{2}{5}(1+x)^{\frac{5}{2}} - \frac{2}{3}(1+x)^{\frac{3}{2}} + C \end{aligned} \tag{4}$$

1.4 Area between two curves

Recall:

Suppose $f(x) \geq 0$ is the area beneath the curve $0 \leq y \leq f(x)$, where $a \leq x \leq b$, then:

$$\int_a^b f(x)dx$$

is the area of the curve between a, b.

Theorem 1.2. *Given functions $f(x), g(x)$ the area between the curves from (a, b) can be represented as:*

$$\int_a^b (f(x) - g(x))dx$$

1.5 Examples:

Given two functions $f(x) = 3x^2 + 12$ and $g(x) = 4x + 4$, find the area between the curves from $(-3, 3)$.

$$\begin{aligned}\int_{-3}^{3} (f(x) - g(x))dx &= \int_{-3}^{3} (3x^2 + 12) - (4x + 4)dx \\ &= \int_{-3}^{3} 3x^2 - 4x + 8dx \\ &= x^3 - 2x^2 + 8x\|_{-3}^{3} \\ &\vdots \\ &= 102\end{aligned} \tag{5}$$

Given two functions $(x^2 + 2)$ and $(2x + 5)$, find the **enclosed** area between these two curves.

Find a, b, where the lines intesect $\rightarrow 2x + 5 = x^2 + 2 \ldots (-1 \leq x \leq 3)$ then solve the integral.

$$\begin{aligned}\int_{-1}^{3} (f(x) - g(x))dx &= \int_{-1}^{3} (x^2 + 2) - (2x + 5) \\ &\vdots \\ &= \frac{32}{3}\end{aligned} \tag{6}$$

Given two functions $\sin(x)$ and $\cos(x)$ find the area between these two curves given that $0 \leq x \leq \frac{\pi}{2}$.

Find the intersection between the functions on the range given, then build the integral. This is easily done by observing the functions ***geometrically.***

$$\begin{aligned}\int_0^{\frac{\pi}{4}} (f(x) - g(x))dx &= \int_0^{\frac{\pi}{4}} \cos(x) - \sin(x)dx + \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} \sin(x) - \cos(x)dx \\ &\vdots \\ &= 2(\sqrt{2} - 1)\end{aligned} \tag{7}$$

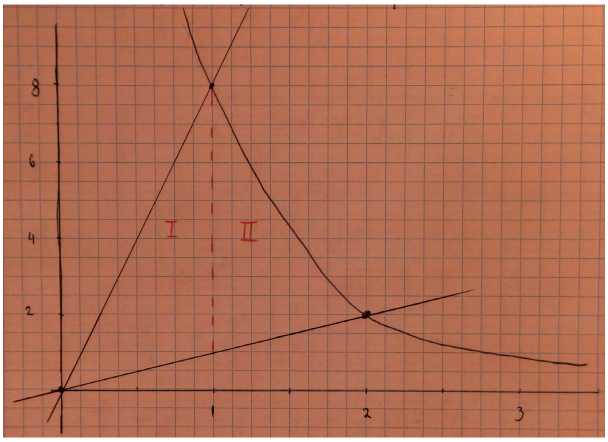

Figure 1:

Given three functions $(\dfrac{8}{x^2})$, $(8x)$ and (x), find the area bounded by these functions.

Find the intersections by observing geometrically(1).We can see that the area is simply the regions $I + II$.

$$\text{Area} = \cdots = 6(\text{Do it later}) \tag{8}$$
