1 Integration Practice and Theory/Application

1.1 FToC I

Recall that we can solve a definite integral using the following definition:

$$\int_{a}^{b} f(x)dx = F(b) - F(a)$$

1.2 Change of Variables / U-Substitution

Suppose we need take the antiderivative of $\int 2x \cos(x^2) dx$, let us suppose that $g(x) = x^2$, then we know g'(x) = 2x. We also know that $\int \cos(x) dx = \sin(x) + C$. If we combine these, we can derive the answer as:

 $\sin(x^2) + C = \int 2x \cos(x^2) dx$

Theorem 1.1. Let us take $u = g'(x) \to \frac{du}{dx} = g'(x)$ and du = g'(x)dx. We can then derive the following:

$$f(g(x)) = \int (f \cdot g)'x$$

$$= \int f'(g(x))g'(x)dx$$

$$= \int f'(u)du$$
(1)

1.2.1 Examples:

Consider the following substitution $u = 3x \to du = 3x \to \frac{1}{3}du = dx$, we can then solve:

$$\int \cos(3x)dx = \frac{1}{3} \int \cos(u)du$$

$$= \frac{1}{3}\sin(u) + C$$

$$= \frac{1}{3}\sin(3x) + C$$
(2)

Consider the following substitution $u = 2x^2 + 1 \rightarrow du = 4x \ dx$, we can then solve:

$$\int \frac{x}{2x^2 + 1} dx = \frac{1}{4} \int \frac{du}{u}$$

$$= \frac{1}{4} ln(u) + C$$

$$= \frac{1}{4} ln(2x^2 + 1) + C$$
(3)

Consider the following substitution $u = 1 + x \rightarrow du = dx \rightarrow u - 1 = x$

$$\int x\sqrt{1+x} \, dx = \int (u-1)u^{\frac{1}{2}}$$

$$= \int u^{\frac{3}{2}} - u^{\frac{1}{2}} du$$

$$= \frac{2}{5}u^{\frac{5}{2}} - \frac{2}{3}u^{\frac{3}{2}} + C$$

$$= \frac{2}{5}(1+x)^{\frac{5}{2}} - \frac{2}{3}(1+x)^{\frac{3}{2}} + C$$
(4)

1.3 Area between two curves

Recall:

Suppose $f(x) \ge 0$ is the area beneath the curve $0 \le y \le f(x)$, where $a \le x \le b$, then:

$$\int_{a}^{b} f(x)dx$$

is the area of the curve between a, b.

Theorem 1.2. Given functions f(x), g(x) the area between the curves from (a,b) can be represented as:

$$\int_{a}^{b} (f(x) - g(x)) dx$$

1.3.1 Examples:

Given two functions $f(x) = 3x^2 + 12$ and g(x) = 4x + 4, find the area between the curves from (-3,3).

$$\int_{-3}^{3} (f(x) - g(x))dx = \int_{-3}^{3} (3x^{2} + 12) - (4x + 4)dx$$

$$= \int_{-3}^{3} 3x^{2} - 4x + 8dx$$

$$= x^{3} - 2x^{2} + 8x\|_{-3}^{3}$$

$$\vdots$$

$$= 102$$
(5)

Given two functions $(x^2 + 2)$ and (2x + 5), find the **enclosed** area between these two curves. Find a, b, where the lines intesect $\rightarrow 2x + 5 = x^2 + 2 \dots (-1 \le x \le 3)$ then solve the integral.

$$\int_{-1}^{3} (f(x) - g(x))dx = \int_{-1}^{3} (x^{2} + 2) - (2x + 5)$$

$$\vdots$$

$$= \frac{32}{3}$$
(6)

Given two functions $\sin(x)$ and $\cos(x)$ find the area between these two curves given that $0 \le x \le \frac{\pi}{2}$. Find the intersection between the functions on the range given, then build the integral. This is easily done by observing the functions geometrically.

$$\int_{0}^{\frac{\pi}{4}} (f(x) - g(x))dx = \int_{0}^{\frac{\pi}{4}} \cos(x) - \sin(x)dx + \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} \sin(x) - \cos(x)dx$$

$$\vdots$$

$$= 2(\sqrt{2} - 1)$$
(7)

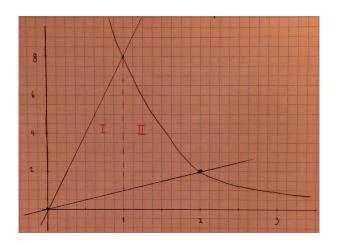

Figure 1:

Given three functions $(\frac{8}{x^2})$, (8x) and (x), find the area bounded by these functions. Find the intersections by observing geometrically(1). We can see that the area is simply the regions I + II.

$$Area = \dots = 6(Do it later) \tag{8}$$
